

Climate Brief 2024 — Global Temperature Trends

Global mean surface temperature in 2024 was approximately **1.55 °C** above the 1850-1900 pre-industrial baseline, making 2024 the warmest year on record. This marks the first time annual warming has exceeded the 1.5 °C threshold highlighted in the Paris Agreement.

Historical temperature anomaly

Ocean heat content also reached a record high. The Arctic sea-ice extent minimum in September 2024 was the third-lowest on satellite record. The World Meteorological Organization notes that the last ten years (2015-2024) were the ten warmest on record.

Regional anomalies

The table below shows regional surface temperature anomalies for 2024 relative to the 1991-2020 baseline. Note that high-latitude regions warm significantly faster than the global mean — a phenomenon known as polar amplification.

Region	Anomaly (°C)	Notes
Arctic	+3.2	Polar amplification
Antarctic	+1.8	Sea-ice loss accelerated
Europe	+1.5	Hottest year on record
Asia	+1.3	Heatwaves in South Asia
North America	+1.2	Western heatwaves
Africa	+1.1	Sahel drought
Oceania	+0.9	Marine heatwave
Global mean	+1.0	vs 1991-2020
